

Good posture is simple and elegant by design in form and function. The body is designed to have the head, rib cage, and pelvis perfectly balanced upon one another in both the front and side views. If the posture is deviated from normal, then the spine is also deviated from the normal healthy position. Abnormal posture has been associated with the development and progression of many spinal conditions and injuries including: increased muscle activity and disc injury, scoliosis, work lifting injuries, sports injuries, back pain, neck pain, headaches, carpal tunnel symptoms, shoulder and ankle injuries, and many other conditions.

YOUR POSTURE VIEWED FROM THE FRONT

Total Shift
0.49 in

Total Tilt
5.5°

Head is shifted 0.09 in right. Head is tilted 3.0° right.

Shoulders are not shifted significantly. Shoulders are tilted 0.7° right.

Ribcage is shifted 0.13 in right.

Hips are shifted 0.26 in right. Hips are tilted 1.7° left.

The Right Q-Angle is 0.8°. The Left Q-Angle is 1.4°.

YOUR POSTURE VIEWED FROM THE SIDE

Total Shift
3.72 in

Total Tilt
18.8°

Head is shifted 2.10 in forward, 14.7° off vertical.

Based on physics, your head now weighs 23 lbs instead of 11 lbs.

Shoulders are shifted 0.17 in forward, 2.7° off vertical.

Hips are shifted 0.83 in forward, 1.4° off vertical.

Knees are shifted 0.63 in forward.

Head vs. Ankle alignment is 2.10 in forward, 1.9° flexed.

Any measurable deviation from normal posture causes weakening of the spine as well as increased stress on the nervous system which can adversely affect overall health.
